
Impact of Morphological Complexity on Per-Token Prediction Error
Routing decouples model capacity from fixed per-token budgets. ($\Delta\rho = -44\%$)
(a) Dense Baseline — fixed per-token budget
$\rho = 0.0801$: complexity drives prediction error uniformly
(b) Proposed RET+TTT — $\alpha(c) = c^{0.5}$ routing
$\rho = 0.0451$: deeper experts absorb morphological edge cases
OLS slope=+63.3
95% CI band
Spearman ρ = 0.1409
n = 200
OLS slope=-242.6
95% CI band
Spearman ρ = -0.4442
n = 200
